Easy Steps to Build Your Latrine

1. Measure and dig pit
   - 1.35m deep for 3 rings

2. Put rings in pit
   - Put ring with big hole on top
   - Build top ring at least 15cm above ground
   - Do not seal the joints of the rings with mortar (cement)

3. Fill around and compact
   - Add and compact dirt where the box will go

4. Add and compact dirt where the box will go

5. Connect the box to the pit
   - Pipe needs to be angled down so it is easy to flush

6. Use mortar to seal the pipe to the ring and box

7. Compact dirt around the box

8. Put the slab on top of the box
   - Use mortar (cement) to seal the slab to the box

Important Tips for Building a Quality Latrine

Build latrine at least 15m away from water sources

Do not seal the ring joints with mortar

This will allow liquid to seep out which will help your pit last longer.

The back of the slab should be slightly higher than the front.

Build top ring at least 15cm above ground

No vent pipe needed!

This will reduce filling and overflow during the rainy season.

Vent pipes provide no benefit and only increase cost. They do not reduce smell and your latrine will not explode.
